

Hofi Chiki

In close collaboration with schools, companies and individuals, we plant native (tiny) forests on Curaçao...

...This contributes to a greener and healthier environment.

More green ensures...

More biodiversity

By planting native trees we re-introduce vanished species back to the island. Animals reap the benefits.

Better air quality

Dense vegetation is an ideal noise barrier against heavy traffic and it contributes to better air by filtering out CO2.

Less flooding

Trees and other vegetation function as sponges by absorbing excess water and releasing it again slowly.

Healthy environment for playing and learning

The forest brings nature closer. Learning in and about nature is both healthy and fun.

What is a tiny forest?

A tiny forest is a native mini-forest of 100m² to 400m² of heavy vegetation which fosters it's own micro climate.

Good for animals...

The many different trees and plants attract birds and insects who in turn take care of spreading the seeds.

...and good for people

A tiny Forest offers children the opportunity to learn about and discover nature in their own living environment.

Ready for the next tiny forest?

We are! Do you have a good idea or would you like more information? (Don't hesitate) and contact us at hofichiki@outlook.com
